

ACTIVE THERMAL MANAGEMENT VALVE

Our multi-ways modular valve provides intelligent control of the various branches of the cooling circuit of any type of vehicle. Our solution enables complex strategies to be implemented to meet all the needs of our customers, and thus:

- reduce CO2 emissions by up to 3 %, by reducing the engine's warm-up time and improving its temperature control.
- increase the range of electric vehicles by optimizing the thermal management of the battery and the electrical components

TECHNICAL FEATURES

- Compact, flexible and modular design, adapting to the customer environment
- Excellent internal sealing, low current consumption
- Electric actuator with integration of a position sensor
- PWM, LIN and SENT communication

BENEFITS

- Energy Efficiency
- Comfort
- Customizable
- Sensor Integration
- Durability
